A Visit To Marine Station KPH

A group of our members trekked out to Point Reyes to visit the ship to shore marine radio station KPH, the staff at KPH spent a good deal of time with us explaining the history of the station and its purpose of passing and receiving messages from ships at sea. The photos below tell a small story of our visit at the receiving station. Two members went on to visit the transmitting site in Bolinas and later joined up with us, many of their pictures will also be posted soon. Another opportunity was to use a straight key to send a Morse code signal on the Amateur CW Bands to other Amateurs who would be listening.

1985

The Last Decade of Western
The formation of MCI was a result of a series of events that began in 1980 when Robert E. Kahn, a former AT&T executive, and a group of investors decided to start a new company to provide long-distance telephone service. Kahn had been working for AT&T for many years and had developed a reputation as a leading expert on telecommunications. He had also been a member of the Bell System's "blue chip" group, which was responsible for the development of the Bell System's long-distance network. Kahn's vision was to create a company that would provide long-distance telephone service that was more efficient and less expensive than the service provided by AT&T. He believed that this could be achieved by using a different technology for long-distance calls, one that would not require the use of the Bell System's network. Kahn's idea was to use a technology called "cellular" or "cellular switching," which would allow calls to be routed through a series of small, interconnected cells rather than through a single, large central office. This would allow calls to be routed more directly and efficiently, reducing the time and cost of long-distance calls. Kahn's idea was revolutionary at the time, and it was this vision that led to the formation of MCI. Kahn's company, MCI Telecommunications Corporation, was founded in 1980 and quickly became a major player in the long-distance telephone market. MCI's success was due to its innovative use of cellular switching technology, which allowed it to provide long-distance service that was more efficient and less expensive than the service provided by AT&T. MCI's success also led to the formation of other long-distance companies, such as Sprint and WorldCom, and ultimately led to the creation of the modern long-distance telephone market.
