Bolinas Transmitter Site KPH

Bob, Mark, Paul

THIS STATION WAS DESIGNED AND CONSTRUCTED
BY THE

RADIO CORPORATION OF AMERICA

THE 200 KW HIGHER FREQUENCY ALEXANDERSON GENERATING
EQUIPMENT WAS MANUFACTURED AND INSTALLED
BY THE GENERAL ELECTRIC COMPANY

THE GENERAL ENGINEERING AND CONSTRUCTION WORK
WAS PERFORMED BY THE
J.G. WHITE ENGINEERING CORPORATION

A Visit To Marine Station KPH

A group of our members trekked out to Point Reyes to visit the ship to shore marine radio station KPH, the staff at KPH spent a good deal of time with us explaining the history of the station and its purpose of passing and receiving messages from ships at sea. The photos below tell a small story of our visit at the receiving station. Two members went on to visit the transmitting site in Bolinas and later joined up with us, many of their pictures will also be posted soon. Another opportunity was to use a straight key to send a Morse code signal on the Amateur CW Bands to other Amateurs who would be listening.

The Last Decade of Western
The formation of MCI was a result of a series of events that began in 1980 when Robert E. Kahn, a former AT&T executive, and a group of investors formed Western Union. Kahn was a pioneer in the field of packet switching and had been working on a project called the "blue box" for several years. He had also been involved in the development of the ARPANET, the precursor to the Internet. Kahn's vision was to create a new kind of communication network that would be more efficient and more reliable than the traditional telephone network. He believed that this network would be essential for the future of business and industry. Kahn's idea was to create a network that would be based on a series of interconnected nodes, each of which would be capable of sending and receiving data packets. This network would be able to route data packets around any obstacles that might be in the way, ensuring that they would always reach their destination. Kahn's network would be a true "packet-switched" network, meaning that data would be broken up into small packets that would be sent independently of one another. This would allow for more efficient use of the network and would also make it more resilient to failure. Kahn's network would be a game-changer for the world of communication. It would be the foundation of the modern Internet and would revolutionize the way we communicate. Kahn's vision was a bold one, but it was one that was ultimately realized. Today, the network that Kahn envisioned is the backbone of the global communication system. It is a testament to his vision and his determination to create a better world. The network that Kahn created is a true masterpiece of engineering and a source of pride for all who have been involved in its development. It is a network that has changed the world and will continue to do so for many years to come.
