

WB6T0U-13 Bolts Across The United States

B

Yesterday February 1st the balloon was heading directly for the Northern California coastline to finish its second orbit around the Earth. Over the evening it most likely passed over its launching point two orbits ago from Lodi California. This Tuesday morning we find the Balloon initiating its third orbit, a noon day static map shows its position near Nebraska. All telemetry maintains in a normal range, no doubt over night the high altitude balloon was pushed along by a brisk jet stream. May you pass by this way again our adventurous traveler!
